Blood cells as a material for examination of mitochondrial function

- **Blood** – easily accessible
- For diagnostic purposes – replace biopsies
- Many studies show possibility to use for respirometric studies

PLT

Monocytes

Lymphocytes

PBMCs – *Peripheral Blood Mononuclear Cells*

- **Selection of the cell type from blood cells** which would reflect bioenergetics of a target organ in various pathophysiological conditions could be crucial for the translational research

Focus on methodological aspects of the work with human blood cells

- Methods for isolation of **PBMCs** and **PLT** from the same blood sample
- Methods for cell counting
- Protocols for respiration of intact and permeabilized cells
- Normalization of respirometric measurements
- Results from **MitoFit study on PBMCs**

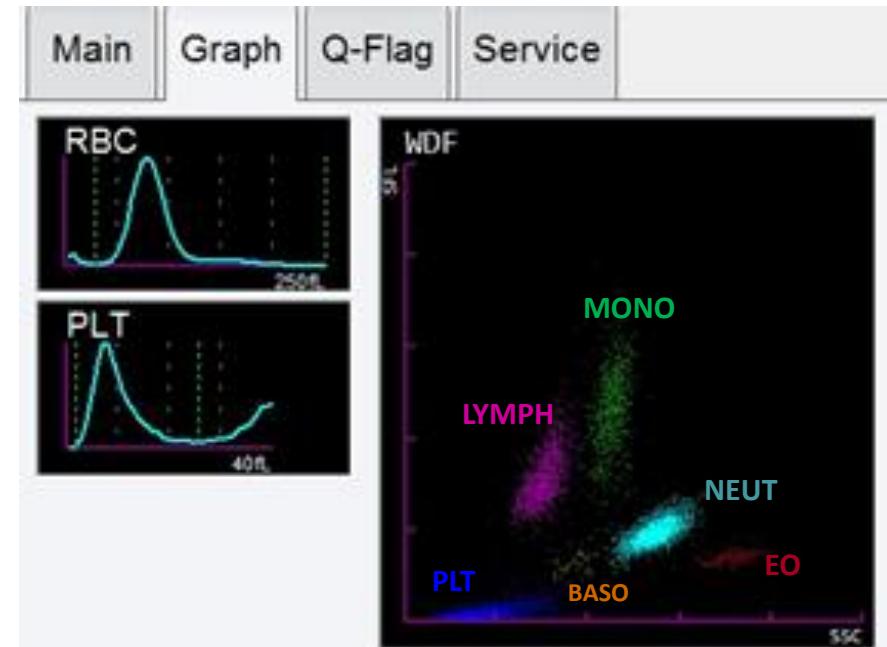

Basic information

- Blood is **collected in K₃EDTA tubes** and transported to the lab at **RT** in thermo-insulating containers, protected from light
- **15-18 ml of blood** is optimal for isolation of **PBMCs** and **PLT** for **4 O2k chambers for each cell type**
- Blood cells in whole blood are counted on **Sysmex XN-350** hematology analyser
- Isolation procedure starts 1 h after blood taking - takes 1 h

Sysmex XN-350 hematology analyzer

Main	Graph	Q-Flag	Service

Cell counting in whole blood

Total number of **PLT** and cells
in **different populations of WBC**

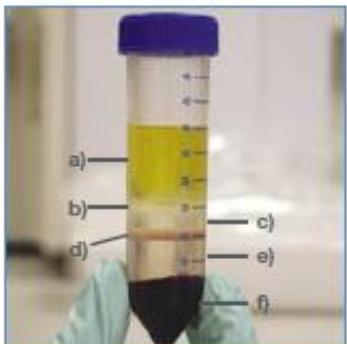

Method 1: isolation of PBMCs

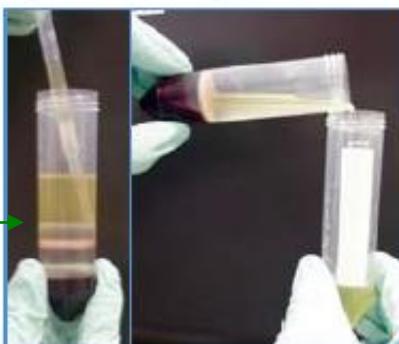

1) Filling with sample material

2) Before centrifugation

3) After centrifugation

4) Harvest by means of a Pasteur pipette or by decanting into another centrifugation tube

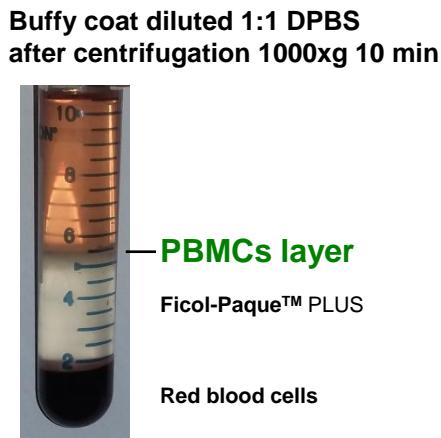

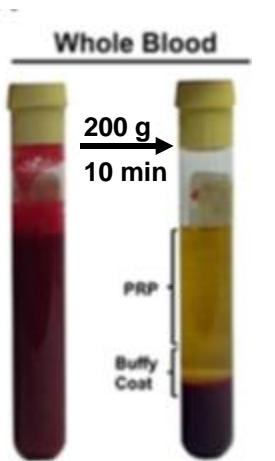

- 50 ml Leucosep tube with 15 ml Ficol-Paque™ PLUS density 1.077 gradient centrifugation medium
- 18 ml whole blood in K₃EDTA tubes
- Dilution 1:1 with DPBS
- Centrifugation **1000xg for 10 min, RT, acceleration (6 of 9), no brakes**
- Collection of layer of PBMCs 5-10 ml, add 25 ml DPBS, centrifugation **120xg** for 10 min, acc. 9, brakes 6 of 9
- Washing with 25 ml DPBS, centrifugation 120xg for 10 min, acc. 9, brakes 6
- Resuspension in **0.5 ml DPBS**

Whole isolation procedure: 1 h

Manufacturer instruction: **250xg → PLT/PBMCs ~ 20**
120xg ~6

Method 2: isolation of PBMCs and PLT

Centrifuge whole blood at **200xg for 10 min**, acc. 9, no brakes!

PLT:

- Transfer PRP into 14 ml round-bottom Falcon tube add 10% of volume 100 mM EGTA
- centrifuge at **1000xg for 10 min**, acc. 9, brakes 1
- gently resuspend the sediment in 4 ml DPBS, 10 mM EGTA
- centrifuge at **1000xg for 5 min**, acc. 9, brakes 1
- Resuspend in **0.5 ml DPBS, 10 mM EGTA**

PBMCs:

Prepare: 2x 14 ml round-bottom Falcon tubes with **4 ml Ficol-Paque™ PLUS** density 1.077 gradient centrifugation medium

- Transfer **buffy coat** into a new tube, dilute 1:1 with DPBS
- Layer carefully 6 ml of buffy coat diluted with DPBS on the top of Ficol-Paque™ PLUS
- Centrifuge **1000xg for 10 min**, RT, acceleration (6 of 9), **no brakes**
- Collect the layer of PBMCs ~ 2 ml, add 2 volumes of DPBS
- centrifuge at **350xg for 5 min**, acc. 9, brakes 6 of 9
- Resuspend in **0.5 ml DPBS**

Sysmex XN-350 hematology analyzer

Morphology

Cell count

Viability

Cell size

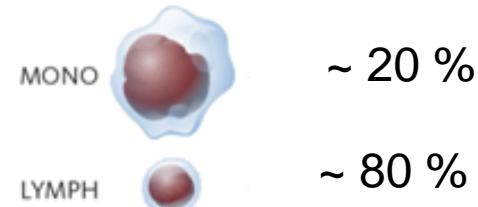

Characteristics of PBMCs preparation:

Cell count: $47.4 \pm 2.8 \times 10^6$ cells/ml

Viability: $86 \pm 1.8\%$

Cell size: $8.79 \pm 0.56 \mu\text{m}$

protein: $82.8 \pm 3.1 \mu\text{g}/10^6$ cells

Purity: PLT/PBMCs $\sim 6 \Rightarrow \sim 21\%$ of protein PLT

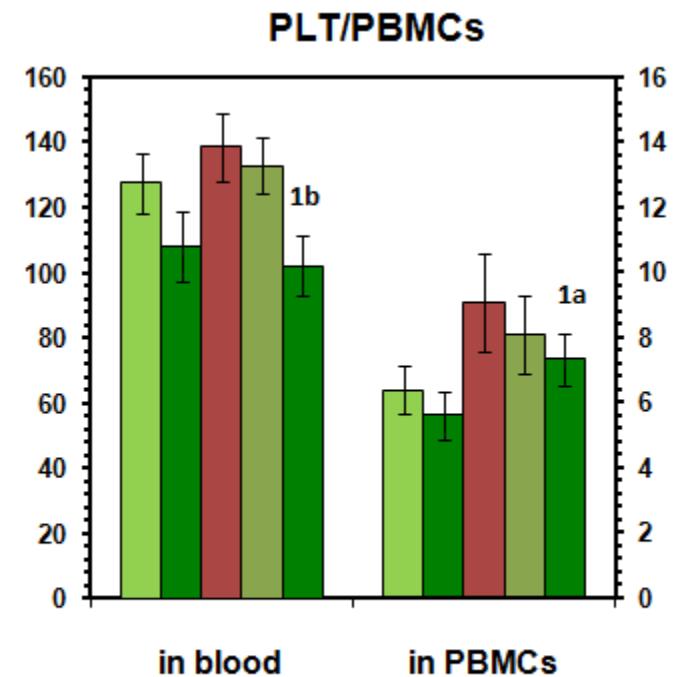

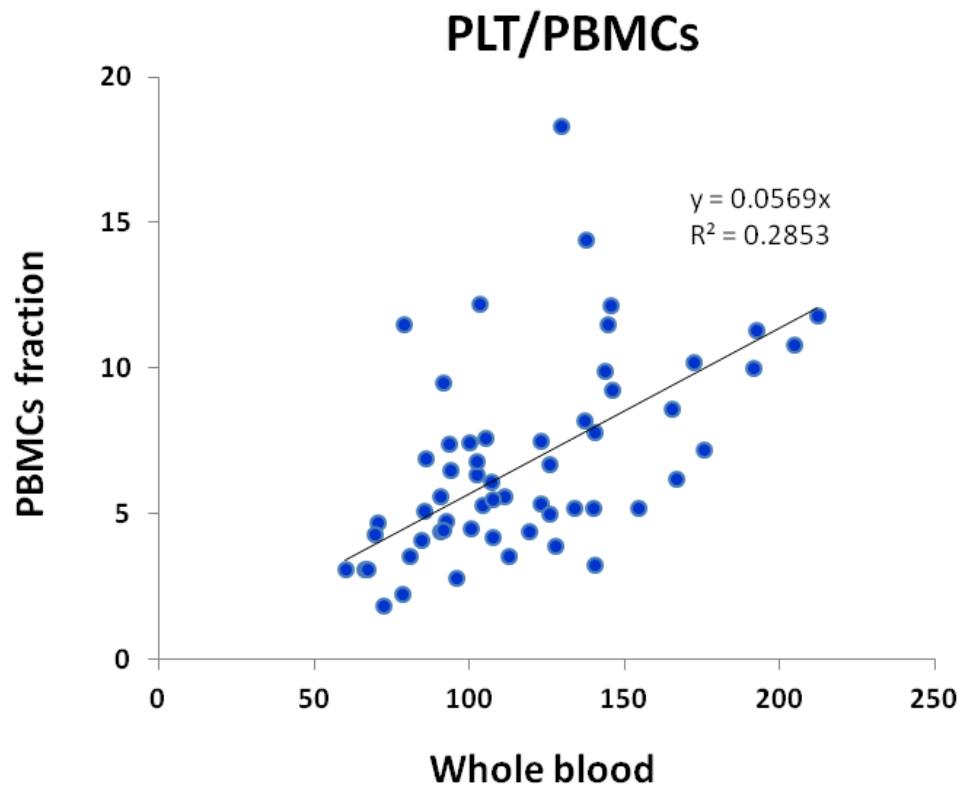

Characteristics of PLT preparation from PRP:

Cell count: $2574 \pm 330 \times 10^6$ cells/ml

protein: $2.91 \pm 0.23 \mu\text{g}/10^6$ cells

Purity: PBMCs/PLT = 0.036% $\sim 1\%$ protein PBMCs in PLT

Contamination of PBMCs with PLT

$$\text{PBMCs fraction/Whole blood} = 0.052 \pm 0.003$$

Freezing subsample of suspension for **later analysis**:

- **proteins**
- **CS** – mitochondrial marker
- **LHD** – marker of cytoplasma **-80°C**

Oxygraph-2k: 4-6 mill **PBMCs**/chamber
 200-300 mill **PLT**/chamber

Lifting the stoppers and adding calculated volume
of cell suspension (80-150 µl) to O2k chamber

Protocols:

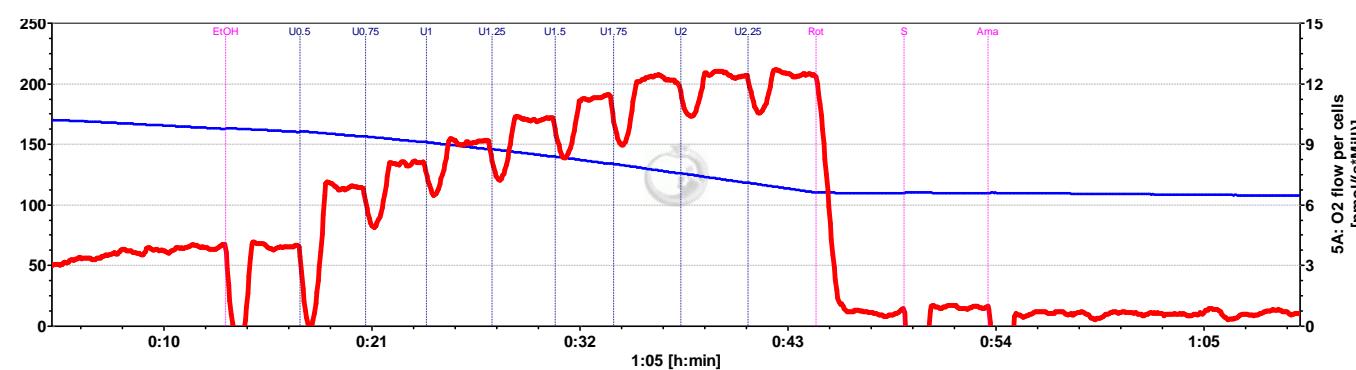

- **intact cells:** **CCP** in **RPMI** without L-glutamine
- **permeabilized cells:** **RP1** and **RP2** in **MiR06Cr+Ctl**

Respiration of intact PBMCs

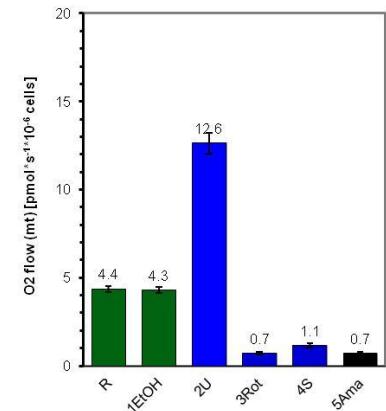

Coupling Control Protocol in RPMI without L-glutamine

CCP_RP1

Cells + EtOH + CCCP + Rot + S + Ama

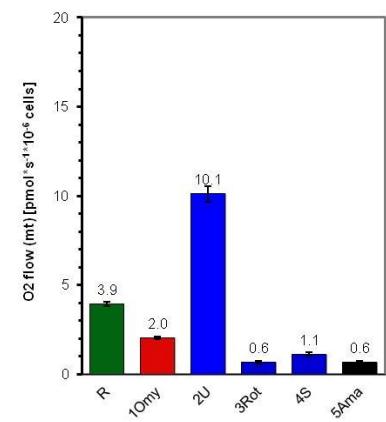

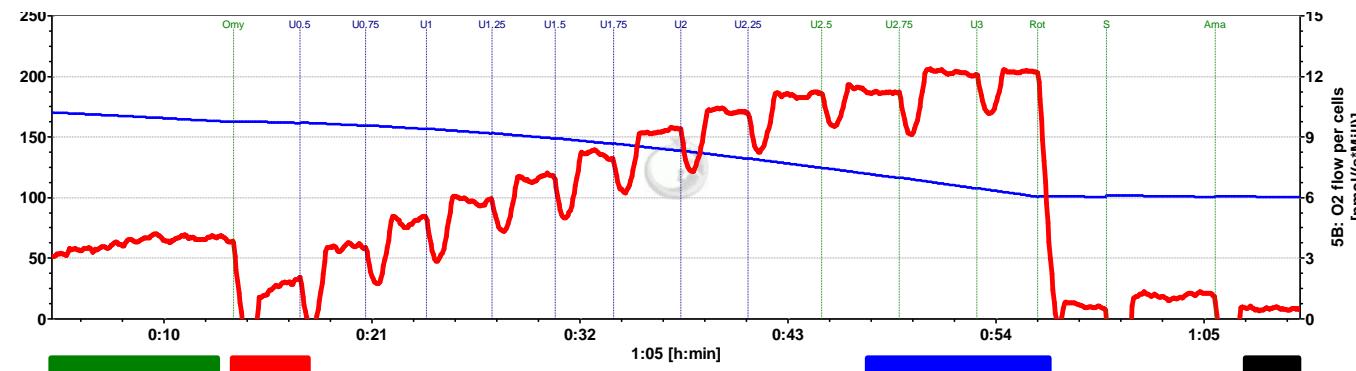

N = 15

CCP_RP2

Cells + Omy + CCCP + Rot + S + Ama

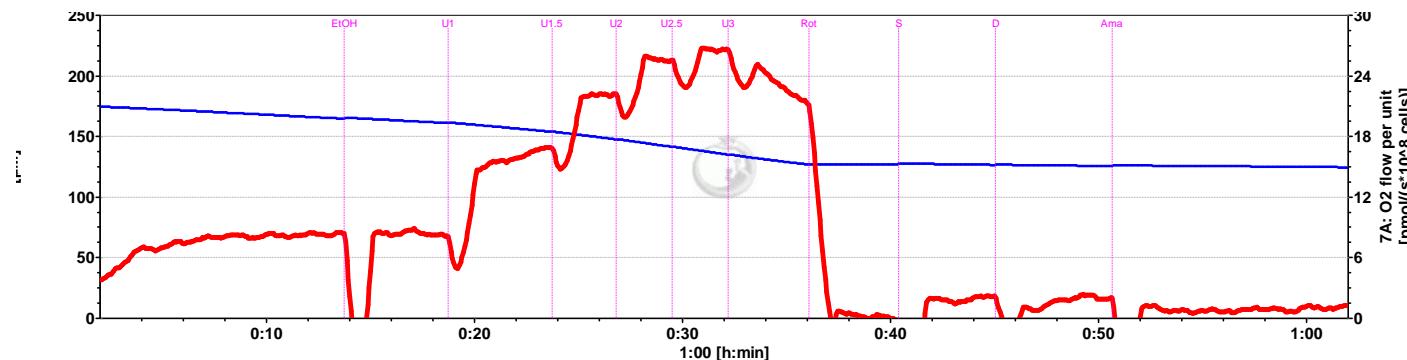

Respiration of intact PLT

Coupling Control Protocol in MiR05

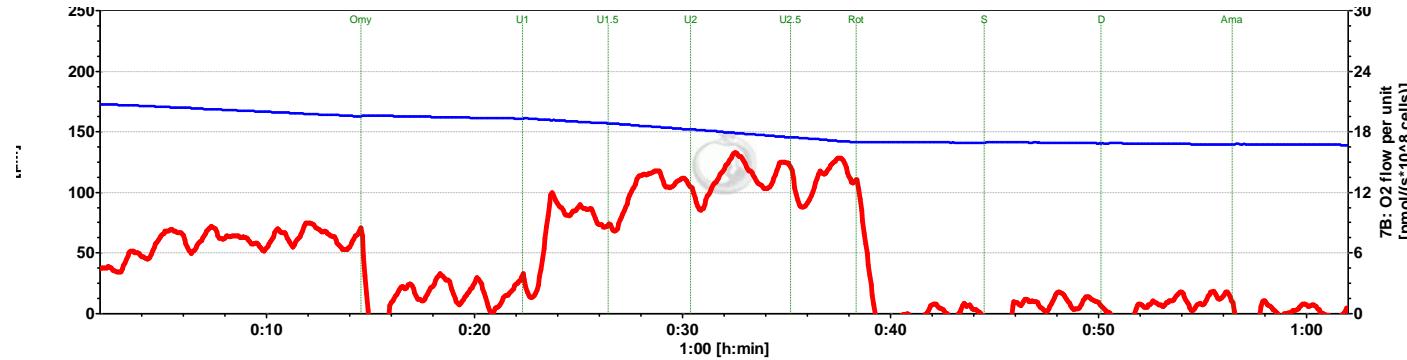

CCP_RP1

Cells + EtOH + CCCP + Rot + S + Ama

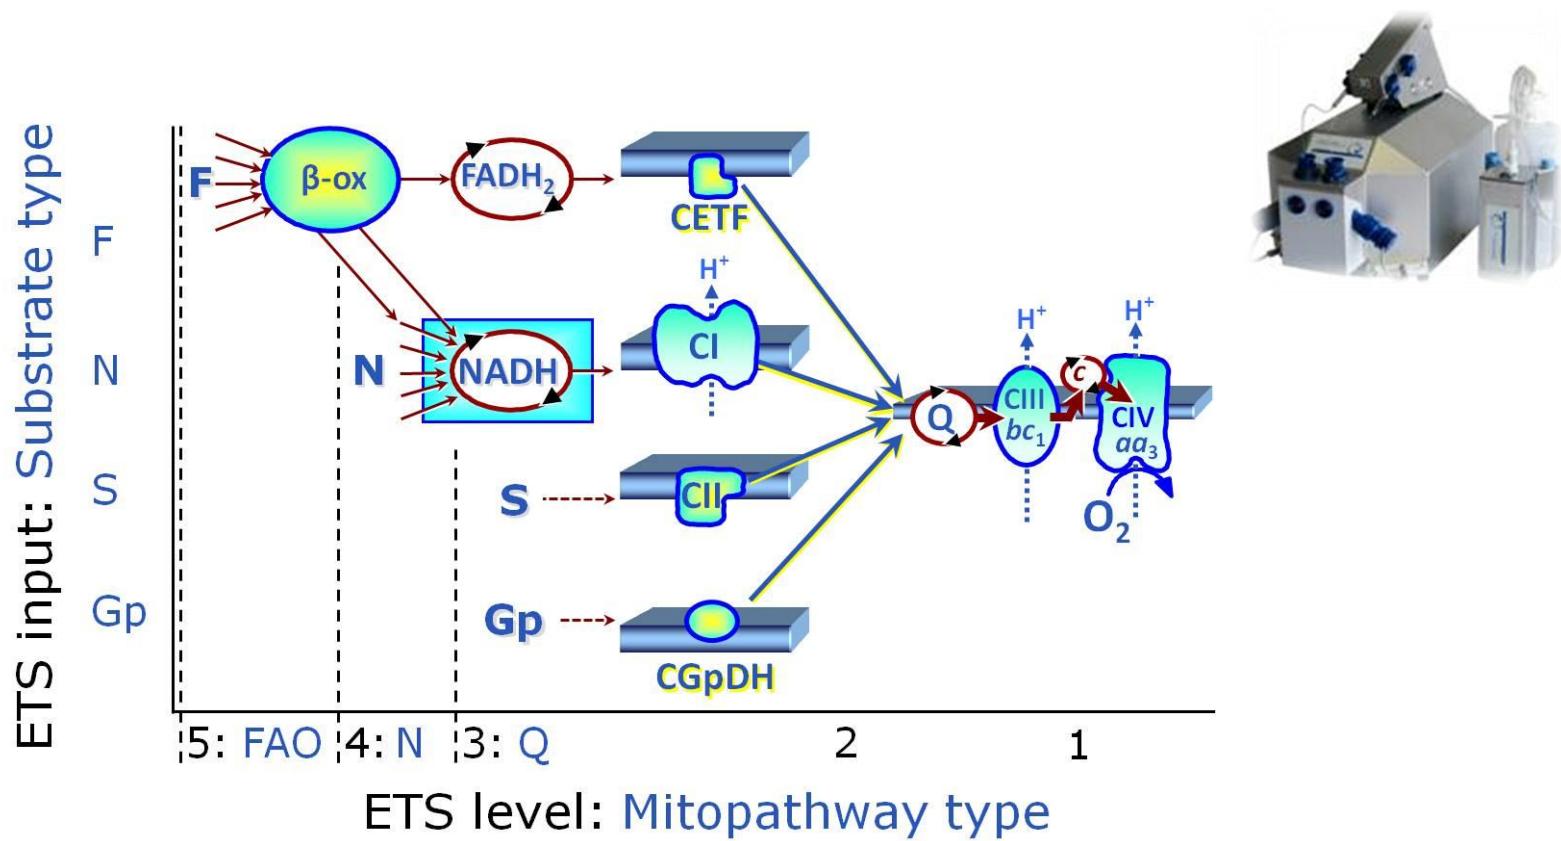

CCP_RP2

Cells + Omy + CCCP + Rot + S + Ama

- ETS after Omy is frequently much lower than without Omy
- Respiratory rates of intact cells depend on medium applied

Respiration of permeabilized PBMCs

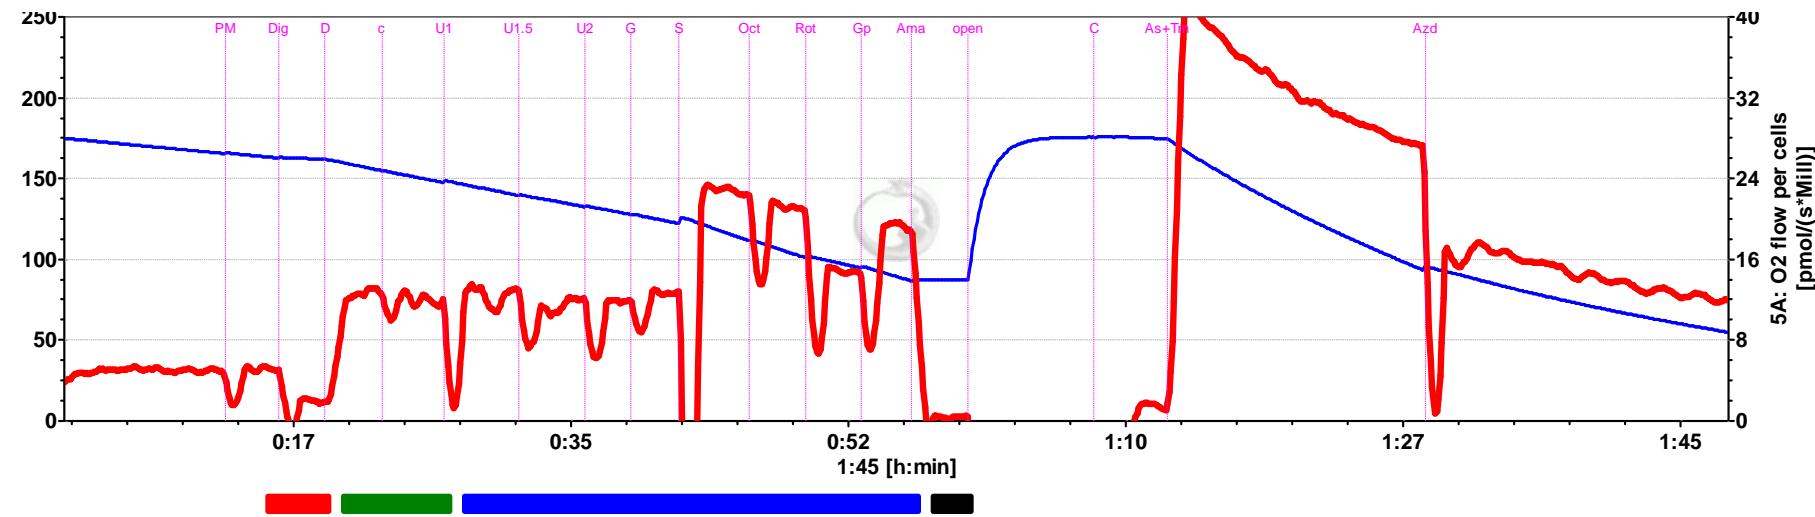

Aim: maximum information about **mitochondrial respiratory system**

Respiration of permeabilized PLT

2016-04-19 P6-01.DLD

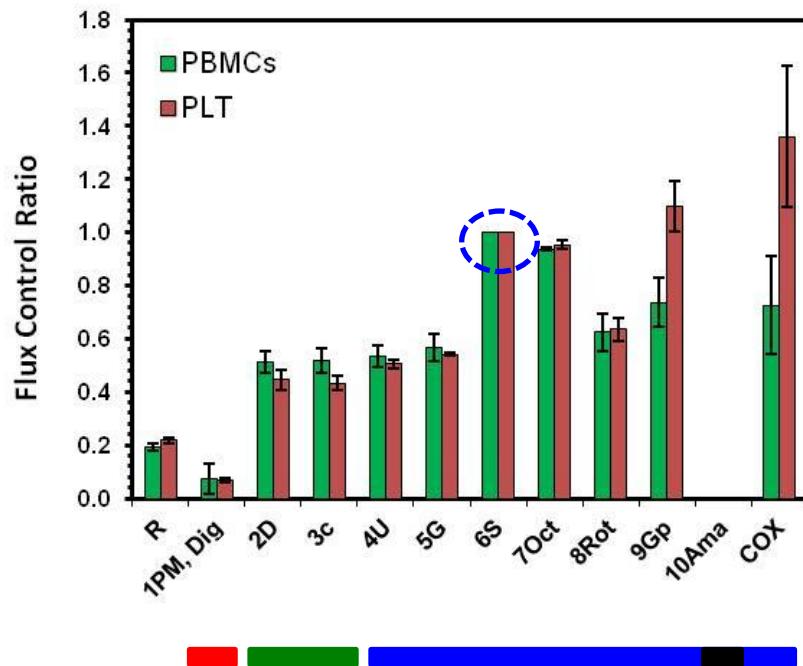

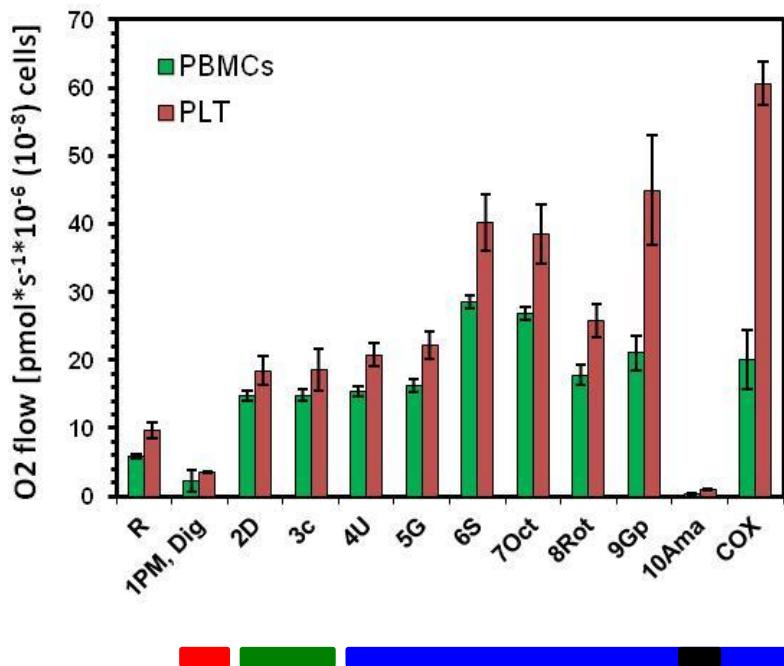

RP1

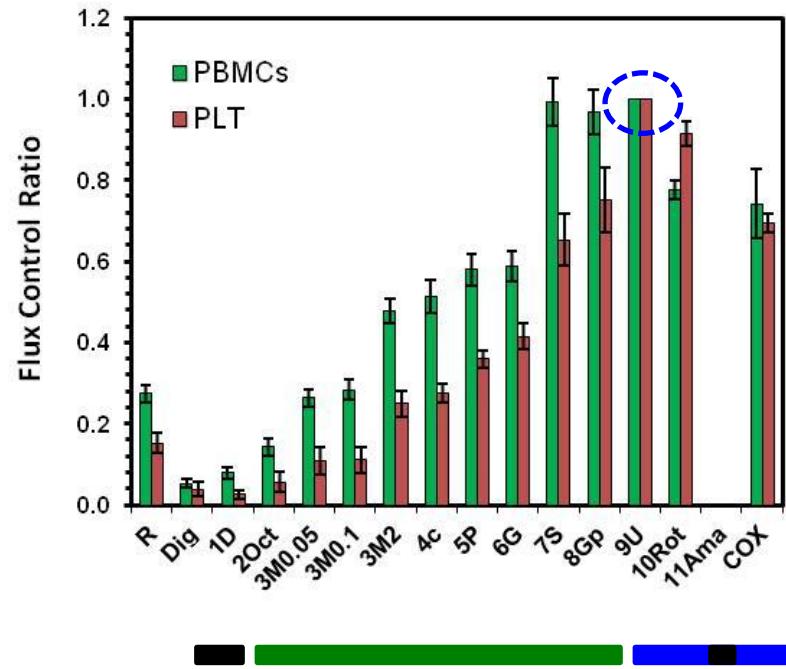

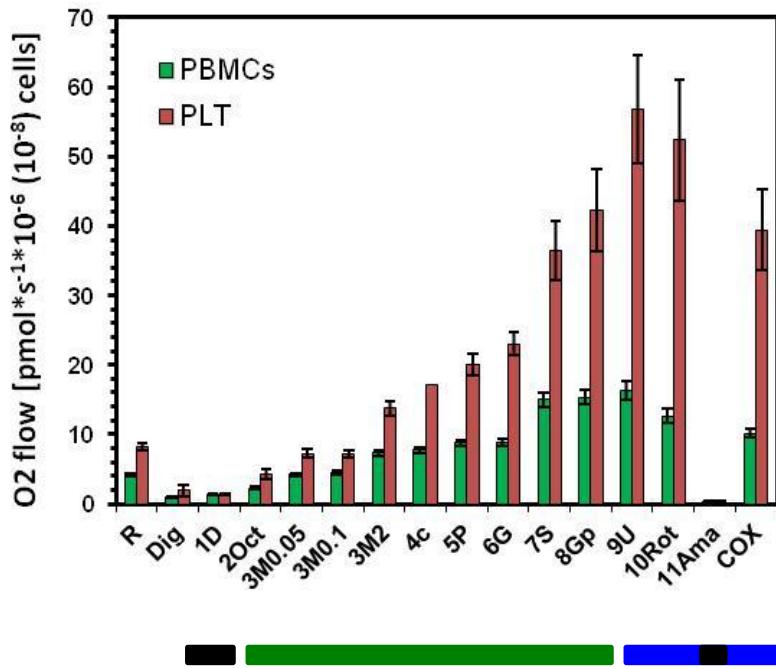

RP2

RP1

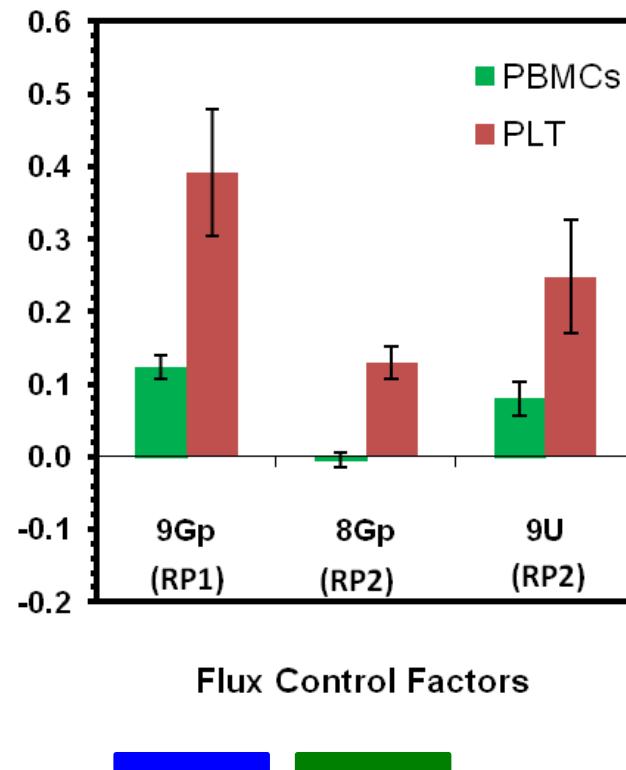

RP2

- The rate of PLT respiration per 10⁸ cells is higher than the rate of PBMCs respiration per 10⁶ cells
- contaminating PLT can significantly affect respiratory rates of PBMCs preparation (PLT/PBMCs ~ 6)

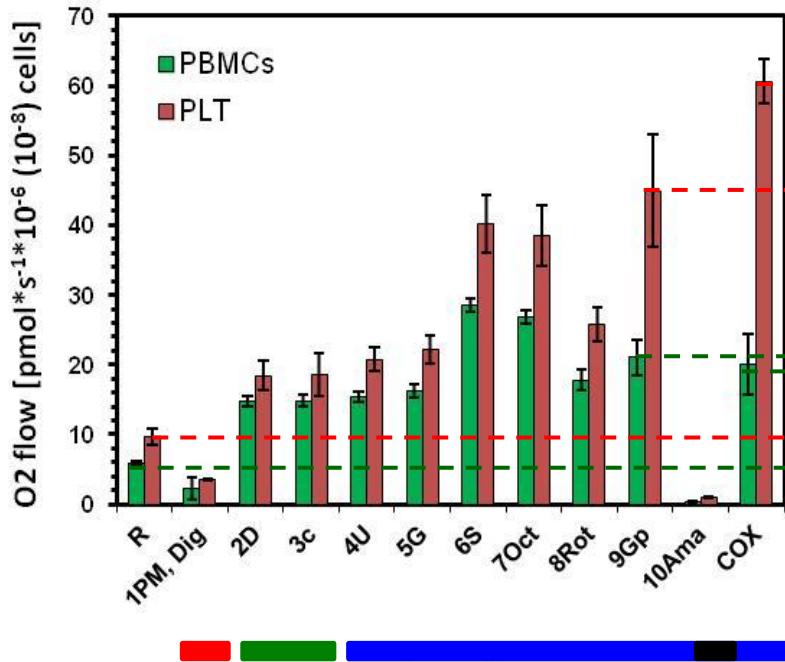

Step changes from RP1 and RP2 significantly different for PBMCs and PLT expressed as Flux Control Factors

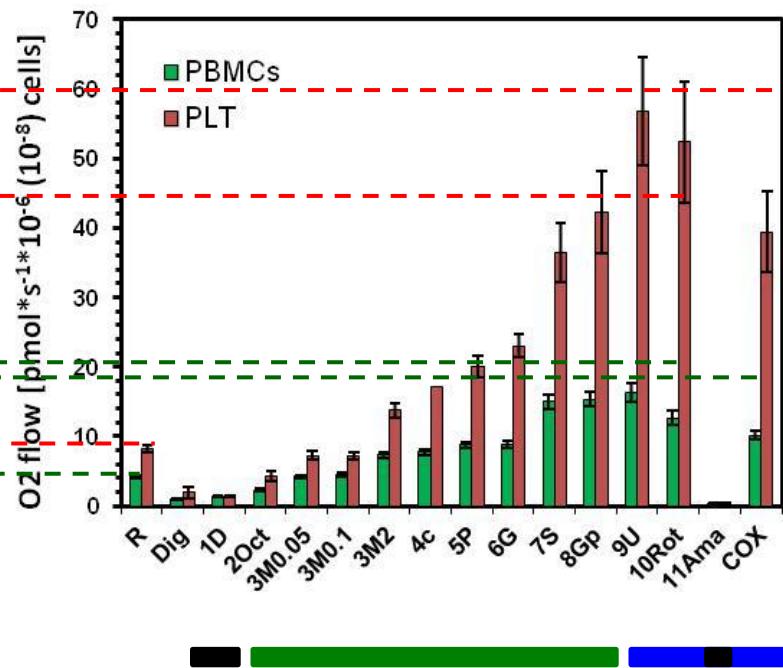

- **PBMCs** and **PLT** have different respiratory patterns as recognized by two harmonized SUIT reference protocols.
- **Contamination of PBMCs with PLT** can significantly affect their apparent respiration and therefore purity of the cell preparation should be emphasized in the selection of isolation method.

Harmonization of reference protocols

RP1

RP2

cross-linked respiratory states don't match in PBMCs or PLT

MitoFit project

- **Active group:**

middle aged subjects 39-64 years old 5 females/10 males participated in a regular and supervised physical activity program over 6 years

- **Untrained group:**

age matched (40-65 years old) 6 females/9 males , no chronic diseases, BMI < 30 not performing regular exercise the last few years

FCF RP2

Summary

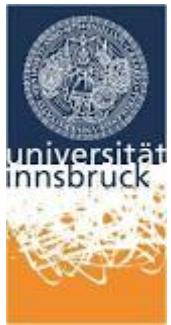

Beginning: no difference between 1 and 2

Untrained after training: ↑ respiration with OctM0.1 ~ FAO

After break: no differences between 1b and 2b

Conclusions

- No difference in mitochondrial respiration between active and untrained group at the same time of sampling
- Difference between 2 sampling times
- Effect of training on FAO ?

WDF Scattergramm

The different fluorescent intensity correspond to the different cell complexity and internal cell structure and allows the recognition of the different leucocytes populations

Karabatsiakis_TP_2014

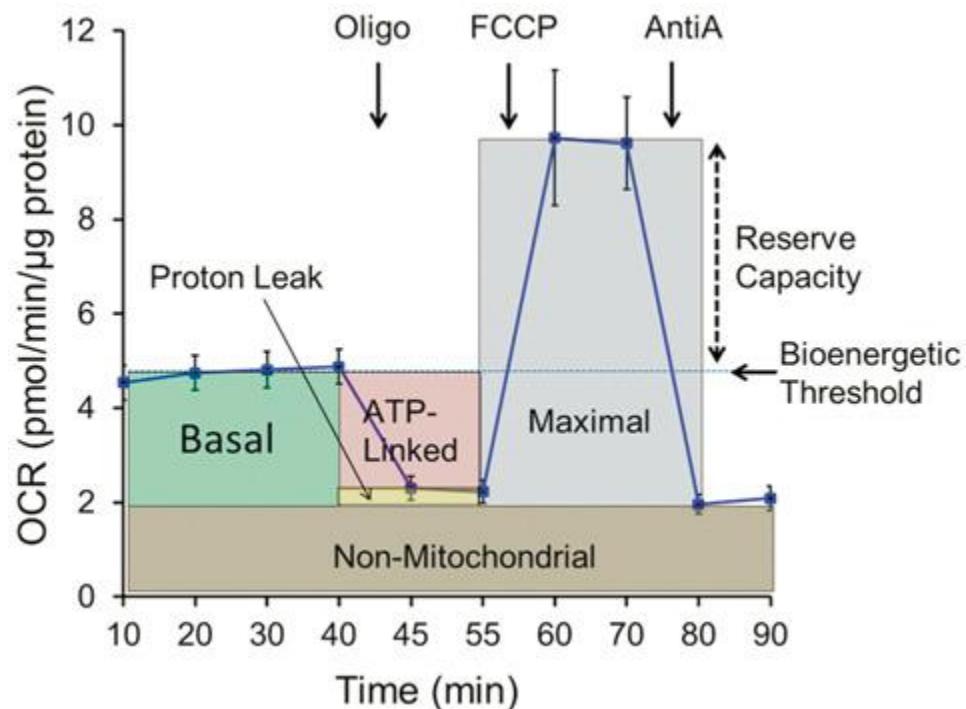

Respiration related to ATP turnover was calculated as the difference between routine and LEAK respiration ($R - L$) and spare respiratory capacity as the difference between maximal uncoupled respiration and routine respiration ($E - R$).⁴²

Following the recommendations of the manufacturer (Oroboros Instruments), the following flux control ratios were calculated for further analyses: routine flux control ratio (routine respiration over uncoupled respiration, R/E) and coupling efficiency (ATP turnover over routine respiration, $(R - L)/R$).

Chacko_CS_2014
